Section 9  Eurocode 1  
EN 1991-1-3:  
Annex C, Annex D  

9.1 Annex C: European Ground Snow Load Maps

This Annex presents the European snow maps which are the result of scientific work carried out under contract to DGIII/D-3 of the European Commission, by a specifically formed research Group. The objectives of this Annex, defined in 1.1(5), are:

— to help National Competent Authorities to redraft their national maps
— to establish harmonised procedures to produce the maps.

![Figure 9.55](image) From Figure C.1 - European Climatic regions.
This will eliminate or reduce the inconsistencies of snow load values in CEN member states and at borderlines between countries. The European snow map developed by the Research Group are divided into 9 different homogeneous climatic regions, as shown in Figures C.1 to C.10.

</table>

Table 9.22 From Table C.1 - Altitude - Snow Load Relationships.

In each climatic region a given load-altitude correlation formula applies and this is given in Table C.1 above where:

- $s_k$ is the characteristic snow load on the ground [kN/m²]
- $A$ is the site altitude above Sea Level [m]
- $Z$ is the zone number given on the map (1; 2; 3; 4; 4,5).

### 9.2 Annex D: Adjustment of the ground snow load according to return period

Ground level snow loads for any mean recurrence interval different to that for the characteristic snow load, $s_k$, (which by definition is based on annual probability of exceedence of 0.02) may be adjusted to correspond to characteristic values by application of Sections D(2) to D(4). If the available data show that the annual maximum snow load can be assumed to follow a Gumbel probability distribution, then the relationship between the characteristic value of the snow
load on the ground and the snow load on the ground for a mean recurrence interval of \( n \) years is given by the formula (D.1):\(^{(1)}\)

\[
\frac{s_n}{s_k} = \left\{ \frac{1 - V \sqrt{\frac{6}{\pi}} \cdot [\ln(-\ln(1 - P_n)) + 0.57722]}{1 + 2, 5923 V} \right\}
\]

where:

- \( s_k \) is the characteristic snow load on the ground (with a return period of 50 years, in accordance with EN 1990:2002)
- \( s_n \) is the ground snow load with a return period of \( n \) years
- \( P_n \) is the annual probability of exceedence (equivalent to approximately \( 1/n \), where \( n \) is the corresponding recurrence interval (years))
- \( V \) is the coefficient of variation of annual maximum snow load\(^{(2)}\).

However, expression (D.1) should not be applied for annual probabilities of exceedence greater than 0.2 (i.e. return period less than approximately 5 years). Where permitted by the relevant national Authority expression (D.1) may also be adapted to calculate snow loads on the ground for other probabilities of exceedence. For example for:

- a. structures where a higher risk of exceedence is deemed acceptable
- b. structures where greater than normal safety is required.

### 9.3 Verification tests

**EN1991-1-3_(c).xls**. 8.40 MB. Created: 09 March 2013. Last/Rel.-date: 09 March 2013. Sheets:

- Annex D.

---

**EXAMPLE 9-AU**- European Ground Snow Load Maps - test 1

**Given:**  Assuming \( A = 100 \) mamsl (meters above mean sea level) and zone number \( Z = 2 \), find the characteristic snow load on the ground \( s_k \) for all the climatic regions on Table C.1 “Altitude - Snow Load Relationship”.

---

\(^{(1)}\) Where appropriate another distribution function for the adjustment of return period of ground snow load may be defined by the relevant national Authority.

\(^{(2)}\) Information on the coefficient of variation may be given by the relevant national Authority.
Solution: Alpine Region:
\[ s_k = (0, 642Z + 0, 009 \left[ 1 + \left( \frac{A}{728} \right)^2 \right] = (0, 642 \cdot 2 + 0, 009 \left[ 1 + \left( \frac{100}{728} \right)^2 \right] = 1, 32 \text{ kN/m}^2. \]

Central East:
\[ s_k = (0, 264Z - 0, 002 \left[ 1 + \left( \frac{A}{256} \right)^2 \right] = (0, 264 \cdot 2 - 0, 002 \left[ 1 + \left( \frac{100}{256} \right)^2 \right] = 0, 61 \text{ kN/m}^2. \]

Greece:
\[ s_k = (0, 420Z - 0, 030 \left[ 1 + \left( \frac{A}{917} \right)^2 \right] = (0, 420 \cdot 2 - 0, 030 \left[ 1 + \left( \frac{100}{917} \right)^2 \right] = 0, 82 \text{ kN/m}^2. \]

Iberian Peninsula:
\[ s_k = (0, 190Z - 0, 095 \left[ 1 + \left( \frac{A}{524} \right)^2 \right] = (0, 190 \cdot 2 - 0, 095 \left[ 1 + \left( \frac{100}{524} \right)^2 \right] = 0, 30 \text{ kN/m}^2. \]

Mediterranean Region:
\[ s_k = (0, 498Z - 0, 209 \left[ 1 + \left( \frac{A}{452} \right)^2 \right] = (0, 498 \cdot 2 - 0, 209 \left[ 1 + \left( \frac{100}{452} \right)^2 \right] = 0, 83 \text{ kN/m}^2. \]

Central West:
\[ s_k = 0, 164Z - 0, 082 + \frac{A}{966} = 0, 164 \cdot 2 - 0, 082 + \frac{100}{966} = 0, 35 \text{ kN/m}^2. \]

Sweden, Finland:
\[ s_k = 0, 790Z + 0, 375 + \frac{A}{336} = 0, 790 \cdot 2 + 0, 375 + \frac{100}{336} = 2, 25 \text{ kN/m}^2. \]

UK, Republic of Ireland:
\[ s_k = 0, 140Z - 0, 1 + \frac{A}{501} = 0, 140 \cdot 2 - 0, 1 + \frac{100}{501} = 0, 38 \text{ kN/m}^2. \]

EXAMPLE 9-AV - European Ground Snow Load Maps - test 2

Given: Assuming \( A = 200 \) maml, \( Z = 2, \ C_e = 1, \ C_i = 1 \) find for the UK:
1) the characteristic ground snow load \( s_k \)
2) the design value of exceptional snow load on the ground for locations where exceptional snow loads on the ground can occur
3) the snow load on roofs for the persistent/transient design situations
4) the snow load on roofs for the accidental design situations where exceptional snow load is the accidental action
5) the snow load on roofs for the accidental design situations where exceptional snow drift is the accidental action and where Annex B applies.

Solution: 1) UK, Republic of Ireland:

\[ s_k = 0,140Z - 0,1 + \frac{A}{501} = 0,140 \cdot 2 - 0,1 + \frac{200}{501} = 0,58 \text{ kN/m}^2. \]

2) With a coefficient for exceptional snow loads equal to \( C_{\text{est}} = 2 \):

\[ s_{Ad} = C_{\text{est}} \cdot s_k = 2 \cdot 0,58 = 1,16 \text{ kN/m}^2. \]

3) With \( C_e = 1, C_i = 1 \): \( s = \mu_1 \cdot C_2 \cdot C_i \cdot s_k = \mu_1 \cdot 1 \cdot 1 \cdot 0,58 = \mu_1 \cdot 0,58 \text{ kN/m}^2. \)

4) With \( s_{Ad} = 1, 16 \text{ kN/m}^2; s = \mu_1 \cdot C_e \cdot C_i \cdot s_{Ad} = \mu_1 \cdot 1, 16 \text{ kN/m}^2. \)

5) \( s = \mu_1 \cdot s_k = \mu_1 \cdot 0,58 \text{ kN/m}^2. \)

---

**EXAMPLE 9-AW** - Adjustment of the ground snow load according to return period - test 3

**Given:** According to Annex D, find the ratio \( s_n/s_k \) for a coefficient of variation of annual maximum snow load \( V = 0,5 \) and a recurrence interval equal to \( n = 90 \) years.

---

Figure 9.56  Characteristic ground snow load for UK and Republic of Ireland (zone N. 2).
Solution: From eq. D.1 with \( P_n = 1/n = 1/90 \approx 0.0111 \):

\[
\frac{s_n}{s_k} = \left\{ \frac{1 - V \frac{\sqrt{\pi}}{\pi} \left[ \ln(-\ln(1 - P_n)) + 0.57722 \right]}{1 + 2,5923 V} \right\} = \left\{ \frac{1 - 0.5 \frac{\sqrt{\pi}}{\pi} \left[ \ln(-\ln(1 - \frac{1}{90})) + 0.57722 \right]}{1 + 2,5923 \cdot 0.5} \right\},
\]

\[
\frac{s_n}{s_k} = \frac{2.527}{2.296} \approx 1.10.
\]

Graph of eq. (D.1) with \( V = 0.5 \).

Figure 9.57 Ratio \( s_n/s_k \) with \( V = 0.5 \) plotted against “n” (years).

For a characteristic snow load on the ground equal to \( s_k = 0.58 \) kN/m\(^2\) (return period of 50 years), we get \( n = 90 \) years:

\[
s_n = 1.10 \cdot s_k = 1.10 \cdot 0.58 = 0.64 \text{ kN/m}^2.
\]
